課程描述 Course Description					
<p>This is the first graduate-level course in theoretical econometrics. It covers statistical topics that are of particular interest in economics and related fields. Basically, it will cover linear regression analysis of single-equation and multiple-equation models. This course is intended as an introduction to econometric methods, and to be a useful prerequisite to further study in theoretical econometrics or applied econometrics.</p> <p>The prerequisites for the course are a basic knowledge of statistics and of matrix algebra. Students should have had at least one semester course in statistics using calculus. There is no specific course prerequisite in matrix algebra, but some familiarity with matrices and the ability and willingness to manipulate them algebraically are required.</p> <p>For each topic, we will have some take-home exercises for your own practice. Students are required to do those exercises by themselves. Discussion between students is allowed and encouraged, but just copying others' solutions without any self-thinking will be not helpful to the understanding of econometric topics. The solutions to take-home exercises will be announced in the class one week after take-home exercises.</p>
