課程描述 Course Description

This course focuses on the ocean's role in the global biogeochemical cycling of selected elements. The impact of humans on the transport of elements within these cycles is needed to be given special emphasis. In this course, the concept of a global geochemical cycle should be introduced. The biogeochemical cycling of the nutrients and trace metals (at least) is considered from the perspective of redox reactions. The atmospheric and aquatic processes will be involved as well. Steady-state model is suggested to explain the global oceanic distributions. The impact of marine pollution especially for the estuarine should be introduced and discussed at the end of the class for the marine environmental application.
