課程描述 Course Description				
<p>This Time Series and Forecasting course is structured to provide students with a thorough grounding in the analysis of time-dependent data and the application of forecasting techniques. The curriculum covers a broad spectrum of topics, from basic statistics and visualization to advanced forecasting methods, including ARIMA, seasonality forecasting, and exponential models. It also integrates cutting-edge approaches using machine learning, deep neural networks, and convolutional models for time series analysis. The course is punctuated with practical sessions for applying learned techniques, a midterm project to assess comprehension and application, and a final presentation to showcase students' forecasting projects. Scheduled breaks and a consultation week are included to enhance learning outcomes and address individual queries.</p>				
課程目標 Course Objectives				
<p>The course aims to introduce the essential knowledge related to time series analysis and forecasting, such as statistics, regression analysis, exponential smoothing, ARIMA modeling, and machine learning. By the end of the course, the students are expected to develop practical skills to analyze time series data effectively and be able to model forecasting problems and anomaly detection in time series.</p>
